Growth - Productivity

Impact - Creative Engineering

Care – Co-creation

Building enterprise AI that delivers measurable business impact.

We deliver value by integrating AI business processes through data management; aligning information systems with AI-driven process changes; developing modern AI-augmented human-machine interfaces; and providing change management advisory.

AaltoAI Hackathon 2026 · Challenge by Norrin

Trustworthy process monitor

Norrin

A sensor drifts for weeks before anyone sees the fault.

WHY IT GOES UNNOTICED

Readings stay inside the expected range, so no alarm fires. When output quality finally drops, the cause sits buried in dashboards and logs.

The same shape shows up in business data, where thousands of small manual-entry errors each pass validation on their own.

Norrin

YOUR CHALLENGE

Build an agent that reads an undocumented sensor stream, infers what each signal measures, separates broken data from a broken process, and hands the operator a diagnosis they can question and overturn.

01 NO LABELS

The system works out what each column is. No manual labelling, no hand-written prompt.

02 EVIDENCE FIRST

Every inference shows the correlation, lag or distribution behind it.

03 DATA BEFORE PROCESS

A dead sensor is not a process fault. The data gets checked first.

04 NOTHING LEAVES

Raw rows stay in the plant. Only derived summaries go to a model.

WHAT TO DELIVER

Build these eight, and show the evidence behind each.

UNDERSTAND

Sensor report

Inferred role per sensor, with evidence and confidence.

Quality checks

Baseline checks plus rules compiled from plain language.

DETECT

Drift output

Deviation over time, flagged to the signal responsible.

Diagnosis

Fault type, ranked sensors, step-by-step reasoning.

CONTROL

Operator controls

Accept, question or override any output.

Decision log

Every inference, its evidence and every override.

PROVE

Adaptability

A second-domain run or an architectural walkthrough.

Data-flow record

What leaves, to which model, and why.

Norrin

Four criteria carry the score. One is a gate.

1

End-to-end autonomy

No manual labelling, no hand-tuned prompts.

2

Data quality

A dead sensor and a drifting process read differently.

3

Human in the loop

Every flag traces to evidence an operator can challenge.

4

Adaptability

The same logic runs on messy business records.

Raw data never leaves the operator's environment.

Norrin

Why choose our challenge?

The winning team takes home €2,000 and a chance to visit our Espoo office.

Norrin

Practical information and datasets are included in the challenge package and will be posted in the Discord channel.
Good Luck!

Do not hesitate to ask questions.
